

SVHS to Composite / Composite to SVHS Video adapters

The Calrad video converters are bi-directional and pass video from one standard to the next. The adapters do not increase or change video resolution. Multistage passive filters provide mixing and separation of the luminance and chrominance video signals. Gold plated connectors and contacts provide low loss signal paths between connectors to achieve maximum performance. Video bandwidth up to 10Mhz. The adapters provide problem solving solutions for connecting various video products. The plastic versions of the 35-499 adapters are the economy series and provide less accurate video signal conversions.
